Safety Instructions

Copeland Scroll™ compressors with CoreSense™ Diagnostics technology are manufactured according to the latest U.S. and European Safety Standards. Particular emphasis has been placed on the user’s safety. Safety icons are explained below and safety instructions applicable to the products in this bulletin are grouped on Page 3. These instructions should be retained throughout the lifetime of the compressor. You are strongly advised to follow these safety instructions.

Safety Icon Explanation

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION, used with the safety alert symbol, indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE is used to address practices not related to personal injury.

CAUTION, without the safety alert symbol, is used to address practices not related to personal injury.
Instructions Pertaining to Risk of Electrical Shock, Fire, or Injury to Persons

### ELECTRICAL SHOCK HAZARD

- Disconnect and lock out power before servicing.
- Discharge all capacitors before servicing.
- Use compressor with grounded system only.
- Molded electrical plug must be used when required.
- Refer to original equipment wiring diagrams.
- Electrical connections must be made by qualified electrical personnel.
- Failure to follow these warnings could result in serious personal injury.

### PRESSURIZED SYSTEM HAZARD

- System contains refrigerant and oil under pressure.
- Remove refrigerant from both the high and low compressor side before removing compressor.
- Use appropriate back up wrenches on rotolock fittings when servicing.
- Never install a system and leave it unattended when it has no charge, a holding charge, or with the service valves closed without electrically locking out the system.
- Use only approved refrigerants and refrigeration oils.
- Personal safety equipment must be used.
- Failure to follow these warnings could result in serious personal injury.

### BURN HAZARD

- Do not touch the compressor until it has cooled down.
- Ensure that materials and wiring do not touch high temperature areas of the compressor.
- Use caution when brazing system components.
- Personal safety equipment must be used.
- Failure to follow these warnings could result in serious personal injury or property damage.

### COMPRESSOR HANDLING

- Use the appropriate lifting devices to move compressors.
- Personal safety equipment must be used.
- Failure to follow these warnings could result in personal injury or property damage.

Safety Statements

- Refrigerant compressors must be employed only for their intended use.
- Only qualified and authorized HVAC or refrigeration personnel are permitted to install, commission and maintain this equipment.
- Electrical connections must be made by qualified electrical personnel.
- All valid standards and codes for installing, servicing, and maintaining electrical and refrigeration equipment must be observed.
INTRODUCTION

Overview

CoreSense™ Diagnostics is a breakthrough innovation for troubleshooting residential air conditioning and heat pump systems. The CoreSense Diagnostics module is easily installed in the unit electrical panel near the compressor contactor. By using the compressor as a sensor, CoreSense Diagnostics helps the service technician more accurately troubleshoot system and compressor fault conditions.

CoreSense Diagnostics also provides compressor and system protection through its proprietary lockout feature. Depending on the severity and frequency of the fault that caused the trip condition, the CoreSense Diagnostics module can lockout the compressor contactor to prevent damage to the compressor and system components. Less severe fault conditions resulting in an occasional trip will not result in a lockout condition.

Flashing LEDs communicate ALERT and LOCK codes to the service technician.

Application Restrictions and Types

The CoreSense Diagnostics (571-0072-00) module is designed and qualified for use with ZPS*K5 single-phase Copeland Scroll® UltraTech™ compressors.

Product Specifications

Operating Temp: - 40°F to 150°F (- 40°C to 65°C)
Storage Temp: - 40°F to 175°F (- 40°C to 80°C)
Supply Voltage: 18 to 28VAC, 48 to 62Hz
Module Current Sensing Range: 2 to 30A
Maximum Power Consumption: 2.5 VA (Excluding solenoid load)

INSTALLATION

Mounting

Four #8 or #10 self tapping or sheet metal screws are required for installation of the module. The maximum mounting screw torque is 20 in.lbs. Locate the module near the compressor contactor (wire routing for compressor run, common, and start wires will be easier in this position). The module can be mounted in any orientation and LEDs should be visible for ease of service.

The compressor’s run (R), common (C), and start (S) wires are routed through the holes in the CoreSense module marked “R”, “C”, and “S”. See Figure 1.

Terminal Description

The terminals for the CoreSense Diagnostics module are ¼” spade terminals.

- COMMON (C)
  The 24 volt common terminal for module power.

- DEMAND (Y)
  The demand terminal requires a 24VAC signal measured with respect to the COMMON (C) terminal when there is a call for heating or cooling. A signal above 6VAC indicates the thermostat wants the compressor to be on, while 0-6VAC signal indicates the thermostat wants the compressor to be off.

- SECOND STAGE DEMAND (Y2)
  The demand (Y) and second stage demand (Y2) terminals require a 24VAC signal measured with respect to the COMMON (C) terminal when there is a call for heating or cooling. A signal above 10VAC indicates the thermostat wants the Ultratech solenoid to be energized, while 0-10VAC signal indicates the thermostat wants the Ultratech solenoid to be deenergized.

- PROTECTION (PROT)
  The protection terminal is internally connected to the COMMON terminal through a solid state switch.

- POWER (R)
  The module requires a constant 24VAC supply power to this terminal. The module must receive an independent power supply in order to operate properly. See Figure 4.

- Thermostat Communication (L)
  Provides a 24V signal to an indoor thermostat indicating the number of ALERT flashes displayed on the module. (Reference thermostat manual for available capability)

- Solenoid (DC SOL)
  Provides a connection to the Copeland Scroll
UltraTech second stage compressor solenoid. This solenoid is internal to the compressor, and has a voltage range of 18 to 28VDC. Please refer to bulletin AE-1311 for information on the Copeland Scroll® UltraTech® compressor.

OPERATION
Compressor Protection
The CoreSense Diagnostics module utilizes proprietary algorithms to protect the compressor and system from repeated trips of system pressure controls and the compressor internal overload. The protection terminal of the module should be wired in series with the system low pressure and high pressure cutouts, as well as the compressor contactor. When the module detects a series of trips as described below, it will activate a lockout feature that opens the solid state switch in the module, thereby cutting power to the contactor and de-energizing the compressor.

Module LED Description

POWER LED (Green): indicates the module is powered with 18 to 28 volts.

ALERT LED (Yellow): communicates an abnormal system condition through a unique flash code. The ALERT LED will flash a number of times consecutively, pause and then repeat the process. The number of consecutive flashes, defined as the Flash Code, correlates to a particular abnormal condition. Detailed descriptions of specific ALERT Flash Codes are shown in Table 1.

TRIP/LOCK LED (Red): indicates either a TRIP or LOCK condition.

• TRIP: is indicated by a solid illumination of the LED. This means the compressor is not running and demand is present at the module.

• LOCK: is indicated by a flashing LED correlating to a LOCK condition in which the module will prevent the compressor from starting.

Module Operation/Code Description

Code 1 - Long Run Time
The module will flash yellow one time when the compressor operates for longer than 18 continuous hours. This is an alert code only, and the module will not lockout the compressor for this condition. This code is inactive for heat-pumps.

Code 2 - Compressor (Pressure) Trips
The module will flash yellow two times when the compressor operates from 12 seconds to 15 minutes followed by a trip condition lasting longer than 7 minutes. When four consecutive or ten total Code 2 events are recorded, the module will lockout the compressor and flash red two times.

Code 3 - Pressure Switch Cycling
The module will flash yellow three times when the compressor operates from 12 seconds to 15 minutes followed by a trip condition lasting between 35 seconds to 7 minutes. When four consecutive or ten total Code 3 events are recorded, the module will lockout the compressor and flash red three times.

Code 4 - Locked Rotor Trip
The module will flash yellow four times when the compressor trips within 12 seconds of operation and does not reset and start within 35 seconds. When ten consecutive Code 4 events are recorded the module will lockout the compressor and flash red four times.

Code 5 - Compressor (Moderate Run) Trip
The module will flash yellow five times when the compressor has operated between 15 minutes and 18 hours, followed by a compressor trip lasting longer than 7 minutes. When four consecutive or ten total Code 5 events are recorded, the module will lockout the compressor and flash red five times.

Code 6 - Open Start Circuit
The module will lockout the compressor and flash red six times if the module detects a demand signal in the “Y” terminal and current in the “R” winding of the compressor, but no current is detected in the “S” winding of the compressor for 2 seconds.

Code 7 - Open Run Circuit
The module will lockout the compressor and flash red seven times if the module detects a demand signal in the “Y” terminal and current in the “S” winding of the compressor, but no current is detected in the “R” winding of the compressor for 2 seconds.

Code 8 - Welded Contactor
The module will flash yellow eight times if it has detected line currents in the “S” and “R” windings and demand is absent for 15 seconds.
The module will flash nine times if the module supply voltage drops below 17VAC for 2 seconds. The module will prevent the compressor from starting until adequate voltage is established.

**Code 10 - Over-Current Protection**

When the current at the PROT terminal is greater than 2A for 40ms, the module will flash a Code 10. The red LED will flash 10 times with the yellow LED remaining off. This event will cause a lockout of the compressor and indicates that the module is mis-wired or the contactor coil is shorted to ground.

**NOTICE**

Code 10 is not specified on the module label.

**Resetting Alert Codes**

When the CoreSense Diagnostics module has detected a series of adverse conditions that have caused it to lockout the compressor, and after the issue has been resolved, it is necessary to manually reset the module in order to clear the present alert code.

The primary way of clearing the code and resetting the ALERT or TRIP/LOCK is to cycle the power to the module by disengaging the COMMON (C) Terminal. This will not clear the seven day operating history contained in the module memory. It will only clear the present ALERT or TRIP/LOCK and allow for normal operation.
